 Interwoven WorkSite NT
 Iron Mountain
 JCR
 Lotus Quickplace
 Lotus QuickR
 Microsoft Exchange
 Microsoft SharePoint
 Open Text eDocs
 Open Text LiveLink
 Vignette
 Oracle Stellent UCM
 SAP KM
 Symantec Enterprise Vault
 WebDAV server
 Xerox Docushare

"Content Hub Enterprise is to documents what standard ETL is to structured data!!"

Nicolas Maquaire, EntropySoft CEO

Automate Your Transfers and Transformations

Unstructured data challenges for the large enterprise:

- Need for centralized and federated access to disparate content
- Manage advanced document processes
- Automate records creation or archive with full traceability
- Distribute documents from one to many document management systems

When companies have to manage the flow of structured data, they use ETL (Extract, Transform, and Load) products. Today, the same must be done for unstructured data transfers.

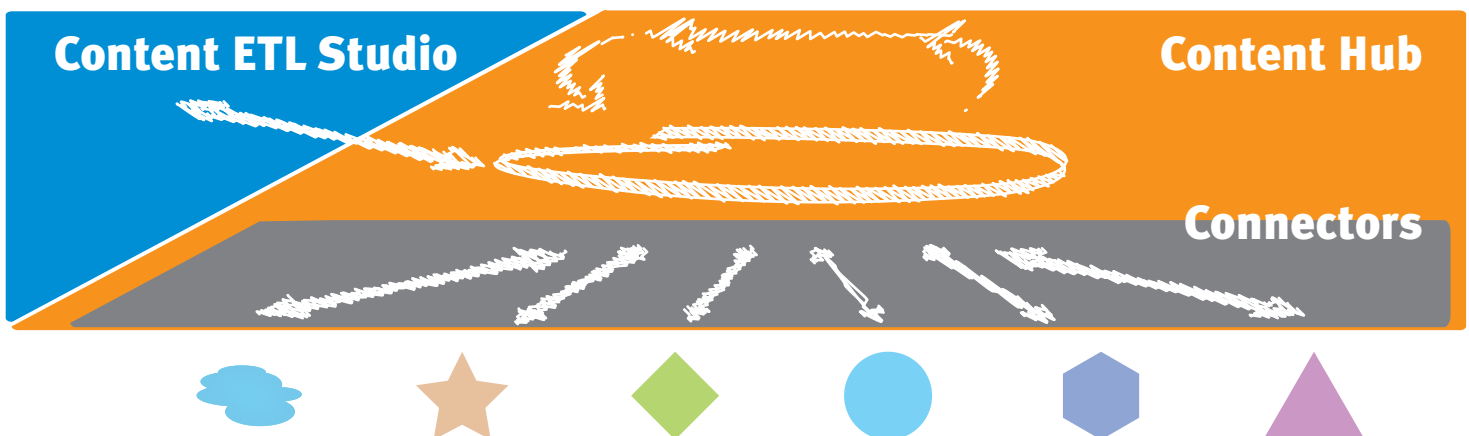

For large companies with multiple content repositories who want to easily move their documents between repositories, and manage their own specific document process requirements, the answer is Content Hub Enterprise

Single Point of Content Access

Content Hub Enterprise is enterprise class, maximum-performance content integration software that provides the most advanced features of content federation, content process automation, SharePoint and cloud integration solutions.

Built on more than 40 Content Connectors, Content Hub Enterprise delivers centralized access to all document repositories whether they are on-site or in the cloud. Like a network hub that provides access to all a companies resources, Content Hub federates all the content silos into one virtual repository shared by all applications.

Any third party product

Handle the Most Complex Document Processes

Content Hub Enterprise edition can help manage even the most advanced document processes. The included Content ETL Studio lets you graphically design and test any document transfer between corporate repositories, make transfers to and from the cloud, or do repository synchronization.

Manage transfers between corporate and cloud repositories, document sharing, distribution, publication or synchronization with ease.

Content Hub Enterprise offers a powerful development studio featuring an intuitive graphical interface to design, build, and debug the most advanced document transfers.

An admin can use the palette of pre-programmed available features such as case, conditions, rules, deduplication, PDF rendering, et., to build a document transfer in a matter of minutes.

Document Transfers in Real-Time, On-Demand, or On Schedule

Thanks to the Track Repository Changes feature of the Connectors, Content Hub Enterprise offers a way to listen to connected application events and take real-time action as soon as documents are created, deleted or modified. The feature is also used by EntropySoft to synchronize parts of two repositories in real-time.

Real-Time Synchronization for Better Collaboration

Information fragmentation is often the latent pain behind the uncertainty of using the most recent version of a document. Forrester Research identified synchronization as the key to removing the barriers surrounding content repositories for better collaboration.

Synchronization allows distributed teams to work on the same content worldwide without disruption. It can also be used to synchronize documents from a front-end user application like Microsoft SharePoint, a corporate application like IBM FileNet or EMC Documentum.

Easily synchronize across the firewall with document repositories of different companies or with the cloud. Documents are exchanged with maximum speed, security and traceability, accelerating and facilitating business while keeping cost under control.

Content Hub Enterprise is possibly the most versatile product on the market to manage all unstructured data transfers. Thanks to its 40+ bi-directional read/write connectors the most popular content-centric systems, and its powerful development studio, it can handle any content transfer and real-time synchronization process across the extended enterprise.
