

## **EntropySoft has announced the availability of its Web Parts and its bi-directional connector for Microsoft SharePoint 2007.**

**Paris, 19th February 2007**, EntropySoft the European leader of the ECI (Enterprise Content Integration) market, specialist in the integration of unstructured data announced the availability of its EntropySoft Web Parts which allow access from SharePoint to all the company's folders and documents. These Web Parts benefit from the abstraction possibilities offered by EntropySoft for reorganised user access. They offer both the functionalities of EntropySoft and the functionalities of traditional applications. Among these functionalities are: the reorganisation of content, transversal searches and the management of exchanges between documentary business databases.

These Web Parts are accompanied by the new bi-directional Microsoft SharePoint 2007 connector. Microsoft SharePoint thus becomes the single access point for the company's information. The Microsoft SharePoint 2007 libraries are connected to the EntropySoft engine.

It is therefore possible from each client application offered by EntropySoft to use the documents managed in Microsoft SharePoint.

The EntropySoft solution offers the opportunity to organise exchange processes between the Microsoft SharePoint databases and the traditional applications or the legal archiving platforms (Records Management).

EntropySoft ECI is an integration and presentation platform. This solution is designed for optimising the management of unstructured company data. This optimisation is carried out in two ways.

From back-office to client applications: EntropySoft is able to separate the service offered to the user from the information system architecture. This solution enables the reorganisation of the access to all a company's documents. Using EntropySoft offers you a unique access point wherever the information is located. EntropySoft allows you to concentrate on the business logic without having to worry about the technological components of the back office. This answer is embodied in the EntropySoft Content Federation solution.

From back-office to back-office: EntropySoft has the power to optimise transfers between all extended enterprise data (the company and its business partners or customers). These transfers can be needed by a process or simply by the deployment of a new application. EntropySoft brings a solution to the problems of divisions caused by the heterogenic nature of these systems. EntropySoft structures and industrialises content exchange between or within companies using its EntropySoft Content ETL solution

With this new connector, EntropySoft is continuing to transform radically the approach of users and organisations in the management of content. EntropySoft helps you optimize the use of your content assets.

### **About EntropySoft :**

EntropySoft is the European player in the ECI (Enterprise Content Integration) market. EntropySoft is the specialist in the integration of unstructured data. EntropySoft's mission is to optimise the use of a company's documentary resources. EntropySoft Content Federation and Content ETL solutions enable the reorganisation of access to information and the industrialisation of content transfers in the extended enterprise.
